

CYBERSPACE.....

I'm sure you've heard this term before....right?....sure you have....really, you have.

Okay, if you haven't, then here it is.....it refers to a group of computers that belong to a world-wide network, like the internet . Are you confused?....yeah, I know, I was too at first.

Here's the scoop. The internet is not any one company or specific group of computers. It's the general term that refers to the complete worldwide system of web sites, users, and communication companies. There are many different companies involved with the internet. You can't just call an internet customer service department. It just does not exist.

So this is what CyberSpace consists of. It's simply a way to define the internet "family".

The thing to remember is that CyberSpace is not one particular company. It consists of every company in the world that either has a web site, hosts web sites, has a communications company involved in the transfer of data, or supports the actions of cyberspace in any way.

So you can see that this encompasses almost every company these days.

We can conclude from the above that CyberSpace cannot be specific to any one group of the many groups (networks) of computers around the world.

CyberSpace is a basic name for the networks forming the Internet.....in a nutshell.

So to make it easy on you, we will relate the term CyberSpace with the Internet, since that is what we are concentrating on. Thus, you can use these terms interchangeably.
